

VDL TBP ELECTRONICS

VDL TBP ELECTRONICS ENVIRONMENTAL POLICY

VDL TBP Electronics is aware of the growing and necessary attention paid to its direct and indirect environment. From this perspective we regard it as our duty to process waste flows in accordance with legislation and to minimise our use of raw materials and consumables.

That's why VDL TBP Electronics wants to continue to improve its environmental management systems and to comply with all relevant national and local environmental legislation. The organisation will comply with all environmental requirements. Furthermore, it will also attempt – where possible – to minimise contamination before it occurs.

VDL TBP Electronics' environmental policy focuses on the interests of all stakeholders. Several examples of this are the installation of solar panels and compliance with RoHS-III- and REACH legislation, together with the separation and accredited disposal of its residual products and their minimisation.

In order to fulfil this commitment, it is the responsibility of employees to apply the environmental system requirements outlined in this manual. VDL TBP Electronics will also seek opportunities to keep up to date with the principles of environmental management.
